Online lecture Basics of Project Management

Summer Semester 2021

Name of the course	Basics of Project Management
Name of the lecturer	**Andreas Rosenstiel**
Description of the course	Project Management (PM) in most modern organization is an essential topic of today's working environment and the organization itself. Time pressure out of shorter product life cycles, the internationalization of projects or the high complexity of production modernizations are just a few examples that justify the existence and underline the importance of PM. Starting from the essential terms and a general PM approach this course shall provide a rough overview on existing PM standards and methods. In the main part a methodology derived from one of these standards will be explained in detail and verified towards its applicability with examples from either logistics or automotive industry. The overall goal of the course is to deliver a systematic approach on PM together with a set of tools in order to enable interested listeners to analyze own problems and to methodically find solutions even when working with complex organizations and premises or tough time restrictions.
